Environmental
Research

Extramural program - grants, fellowships, & national centers of excellence - to complement ORD's intramural program

Air Toxics Exposure Assessment Workshop
San Francisco June 25-27, 2002

Documents that Guide ORD's Air Toxics Research Program

- Air Toxics Research Strategy (ATRS)
 - Key research questions
 - Strategic principles
 - Air Toxic groups / important chemicals within the groups
 - Long Term Goals (concepts)
- Air Toxics Multiyear Plan (MYP)
 - Long Term Goals (defined)
 - Annual Goals and Measures to meet Long Term Goals
 - Progression and inter-relationships of ORD's research
 - Implementation activities of ORD's research
- Both documents will be undergoing peer review and will be publicly available in the near future

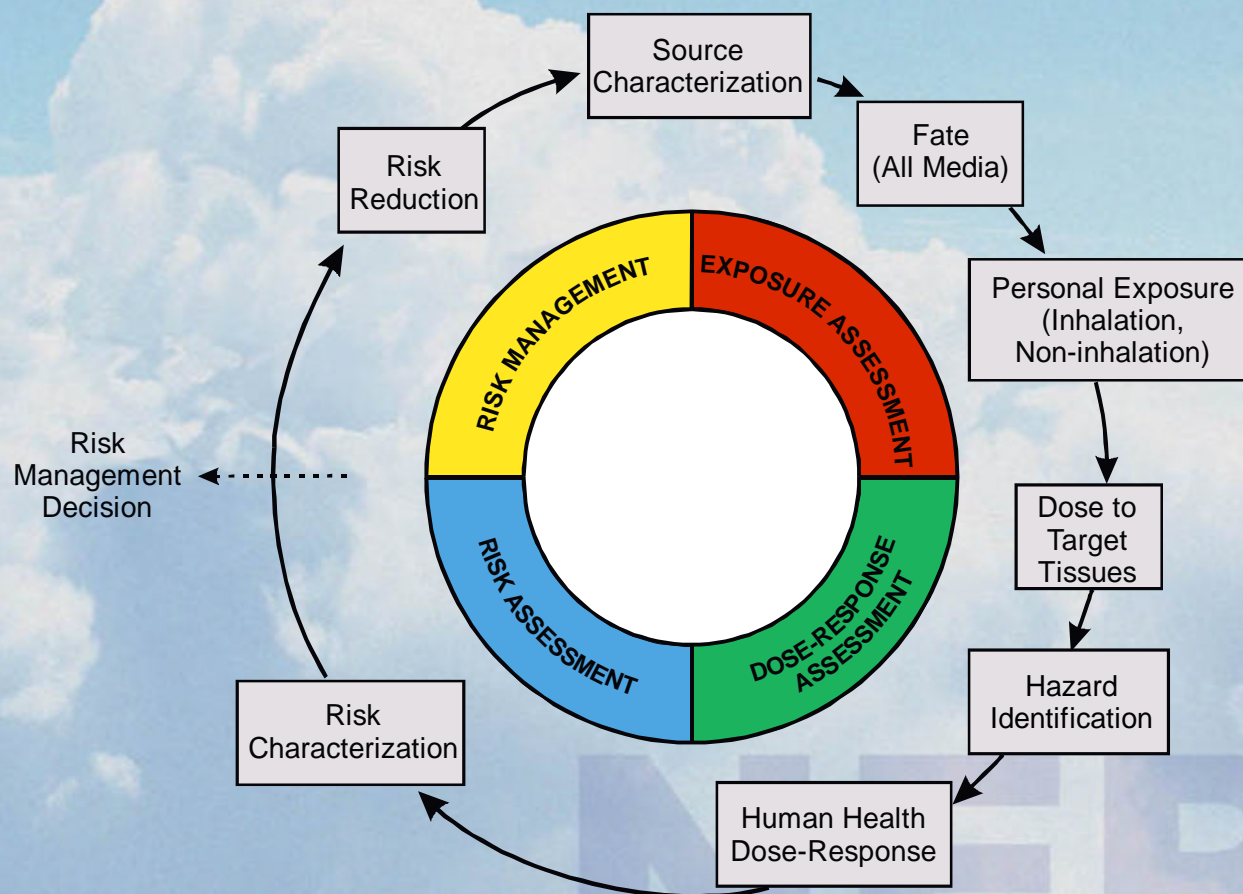

Exposure Assessment Questions in the Air Toxics Research Strategy

- What are the sources of air toxics and what are their characteristics?
- What is the role of atmospheric transport, transformation, fate, and chemistry on air toxics concentrations, including indoor, micro-scale, urban, terrestrial, and regional concentrations?
- What is the relationship of concentrations of air toxics (from outdoor and indoor sources) to personal exposure?
- What are the health hazards and dose-response relationships associated with exposures to air toxics?

Exposure Assessment in the Risk Paradigm

ORD Air Toxics Exposure Assessment Activities

- Source Characterization / Identification
 - Emissions Measurements (NRMRL/NERL)
 - Emission Factors / Source Profiles (NRMRL)
 - Source Apportionment Modeling (NERL)
- Atmospheric Fate
 - Atmospheric Chemistry (NERL)
 - Atmospheric Dispersion Modeling (NERL)
 - Atmospheric Measurements (NERL/NCEA)
 - Measurement Methods (NERL)

ORD Air Toxics Exposure Assessment Activities

- Personal Exposure
 - Human Exposure Measurements (NERL)
 - Human Exposure Modeling (NERL)
 - Multipathway exposures (NERL/NCEA)
- Dose to Target Tissues
 - Dose modeling (NERL/NHEERL/NCEA)
 - Exposure-Dose-Response Relationships (NHEERL)

ORD's Air Toxics Exposure Assessment Research - Source Characterization

- **Objective**

- Characterize emissions from sources of air toxics
- Identify source contributions of measured concentrations

- **Current Activities**

- Emissions measurements for developing emission factors and source profiles
- Source apportionment model development and application

- **Projected Outputs**

- Improved emission factors for developing emission inventories
- Source apportionment modeling data and tools

ORD's Air Toxics Exposure Assessment Research – Fate (Atmospheric Chemistry)

- Objective

- Characterize the atmospheric chemical and physical processes that impact the fate (including secondary formation) of air toxics

- Current Activities

- Literature based chemical mechanisms for the 33 Urban Air Toxics

- Projected Outputs

- Chemical algorithms for incorporation into air quality models

ORD's Air Toxics Exposure Assessment Research – Fate (Atmospheric Modeling)

- **Objective**

- Develop a modeling system that estimates the dispersion and deposition of air toxics at multiple scales

- **Current Activities**

- Community Multiscale Air Quality (CMAQ) Modeling System

- **Projected Outputs**

- Incorporation of benzene, formaldehyde, acetaldehyde, mercury, and dioxin into the CMAQ system
- 1 to 2 additional air toxics to be incorporated per year

ORD's Air Toxics Exposure Assessment Research – Fate (Atmospheric Measurements)

- Objective

- Characterize atmospheric processes that affect the fate of persistent toxics
- Measure ambient concentrations of persistent toxics

- Current Activities

- High Altitude Mercury monitoring
- National Dioxin Air Monitoring Network (NDAMN)

- Projected Outputs

- Data and information to improve risk management decisions
 - understanding of the fate of persistent toxics
 - atmospheric models
 - understanding of long range transport

ORD's Air Toxics Exposure Assessment Research – Fate (Measurement Methods)

- **Objective**

- Develop / refine methods for measuring air toxics in the ambient air and for human exposure studies

- **Current Activities**

- Investigation of the DNSH method

- **Projected Outputs**

- Field validated method for measuring acrolein and other carbonyls for use in the air toxics ambient monitoring network

ORD's Air Toxics Exposure Assessment Research – Personal (Human) Exposure

- **Objective**
 - Characterize the relationships between ambient, outdoor, indoor, and personal concentrations and identify the factors which influence personal exposure
 - Measure indirect exposures to persistent toxics
- **Current Activities**
 - Air toxics human exposure measurement study
 - Human exposure model development
 - Measurements of persistent toxics in food (e.g., breast milk)
- **Projected Outputs**
 - Measurement data in HEDS (NERL database) and data analyses
 - SHEDS – Air Toxics
 - Data on indirect exposure to persistent toxics

ORD's Air Toxics Exposure Assessment Research – Dose to Target Tissues

- Objective

- Develop linkages between exposure concentrations and biological models for effects
- Set the framework for understanding the relationship between concentrations and durations of exposure

- Current Activities

- Development of exposure-dose-response relationships
- Dose modeling (e.g., PBPK models)

- Projected Outputs

- Input for dose response assessments (e.g., RfC, RfD)
- An integrated “Source-to-Dose” human exposure model

A Message from our Health Scientists: The Importance of Matching Health and Exposure Information

Exposure Information

- TRI: mean annual averages
- NATA: mean annual averages

Health Effects Reported

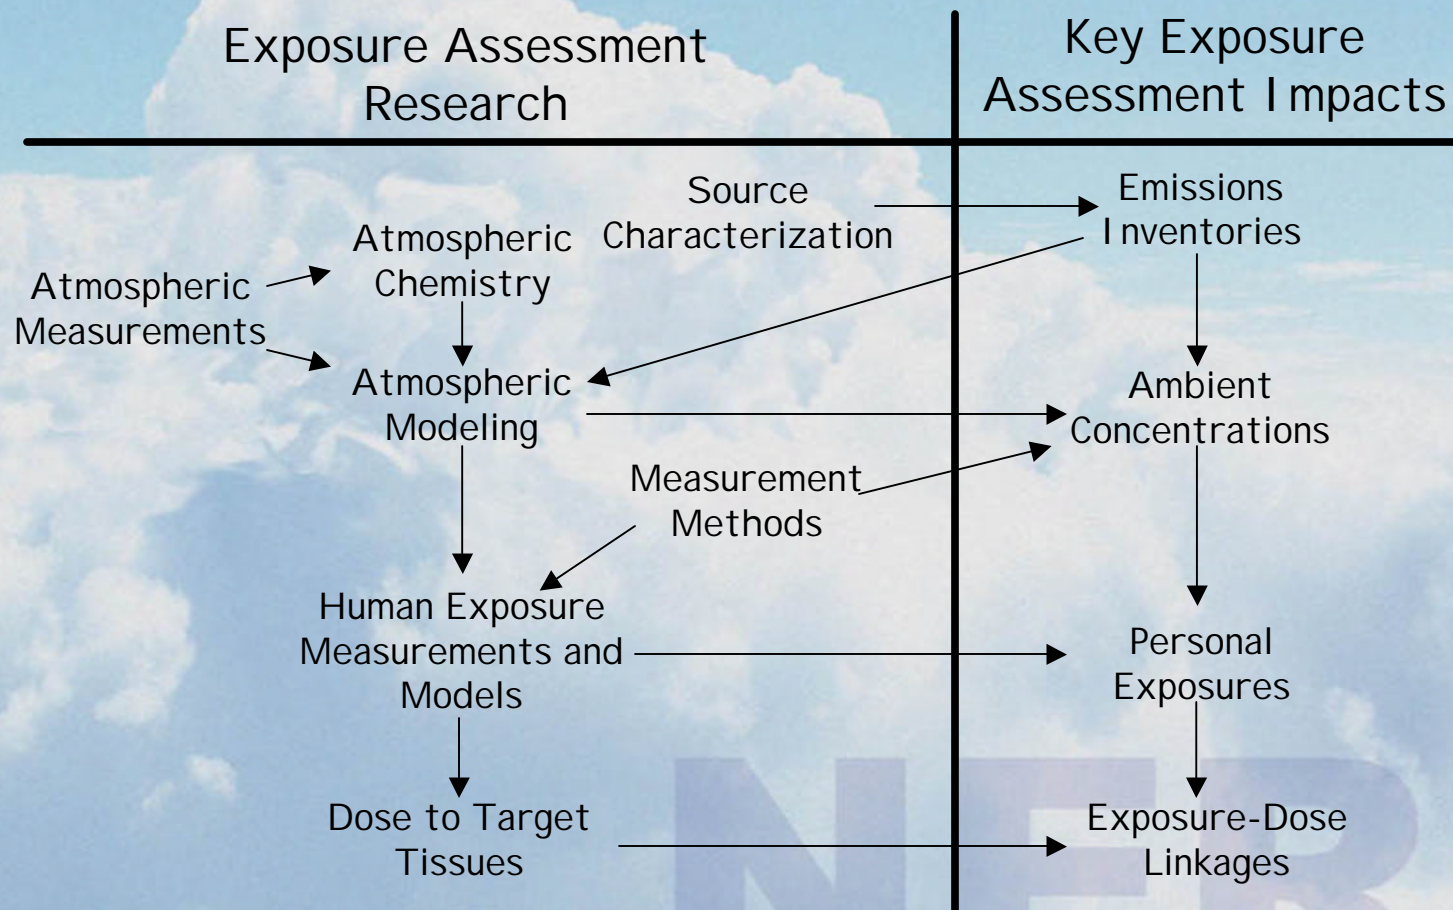

- Acute exposures: 142
- Subchronic: 122
- Chronic: 52

(Cote and Vandenberg,

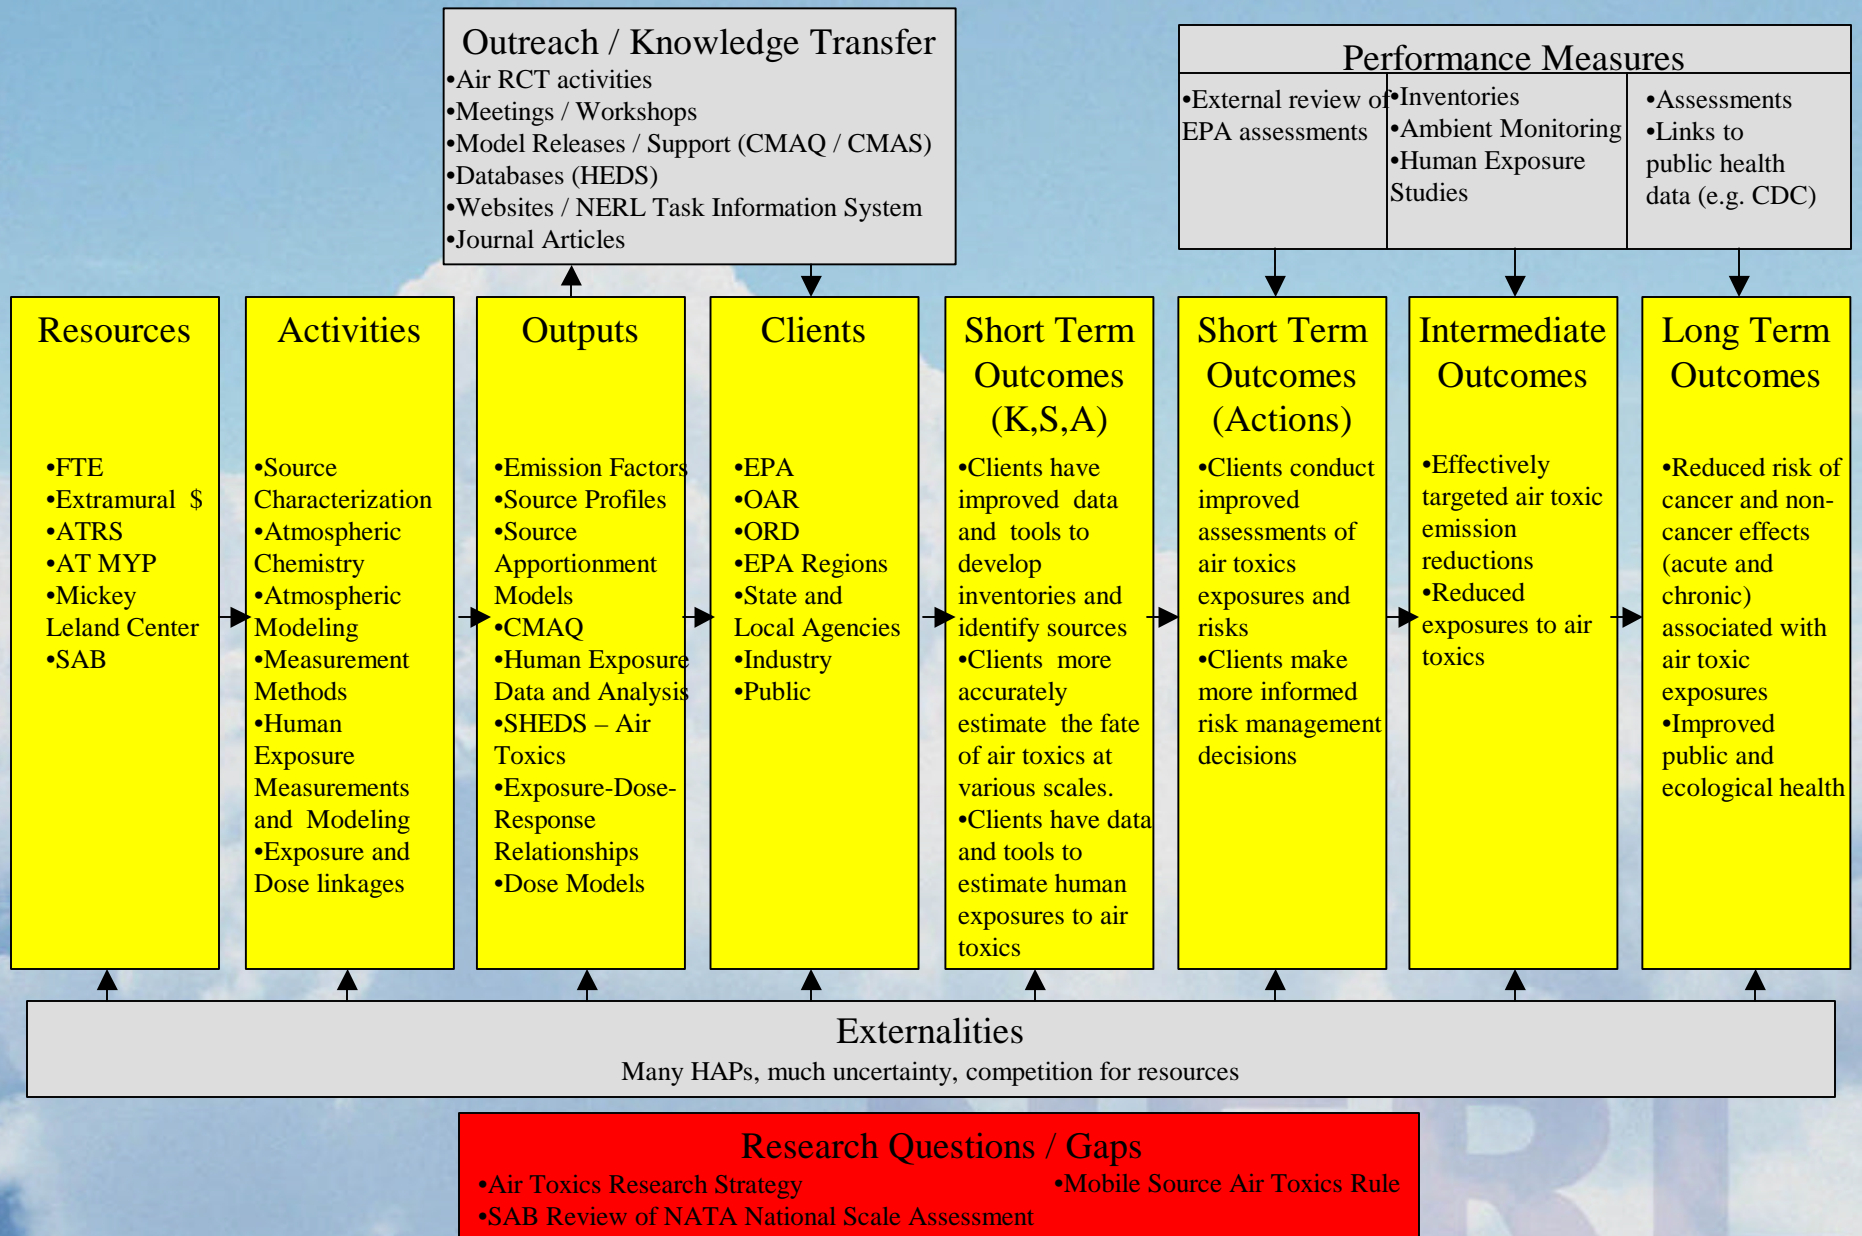

- Incompatible exposure and health information impairs risk¹⁹⁹⁴⁾ assessment
- Exposure assessment should consider the health risks of concern, e.g.
 - For chronic health conditions (e.g. cancer) monitor/model chronic exposures
 - For acute conditions monitor/model acute exposures (e.g. peaks)
 - For reproductive outcomes monitor/model exposures during critical periods of development

How ORD's Research Activities Improve Exposure Assessment

ORD Air Toxics Logic Diagram

Thoughts on this Workshop

- A Great Opportunity!!!
 - To provide information about ORD exposure assessment research
 - To make connections with Regional scientists
 - To better understand the exposure assessment needs of the Regions
